

# Transforming Network Infrastructure towards 5G

**ULAK BASE  
STATION (LTE/5G)**

**MILAT SDN/NFV  
Based NW Tech.**

**LTE/5G  
Core Network**

**R&D for 5G & Beyond**

**E2E, SECURE, SMART, MANEGABLE, NETWORK INFRASTRUCTURES**

ULAK LTE-A Base Stations Deployed since May 2018.

(1500+ Delivered / 1000+ On Air)

Serving 3 operators in Turkey, both governmental & commercial systems

# Milat MAYA Potential Application Areas

**SOFTWARE DEFINED WIDE AREA NETWORK (SD-WAN)**

**LOCAL AREA NETWORK (SD-LAN)**

**SECURITY (SD-Security)**

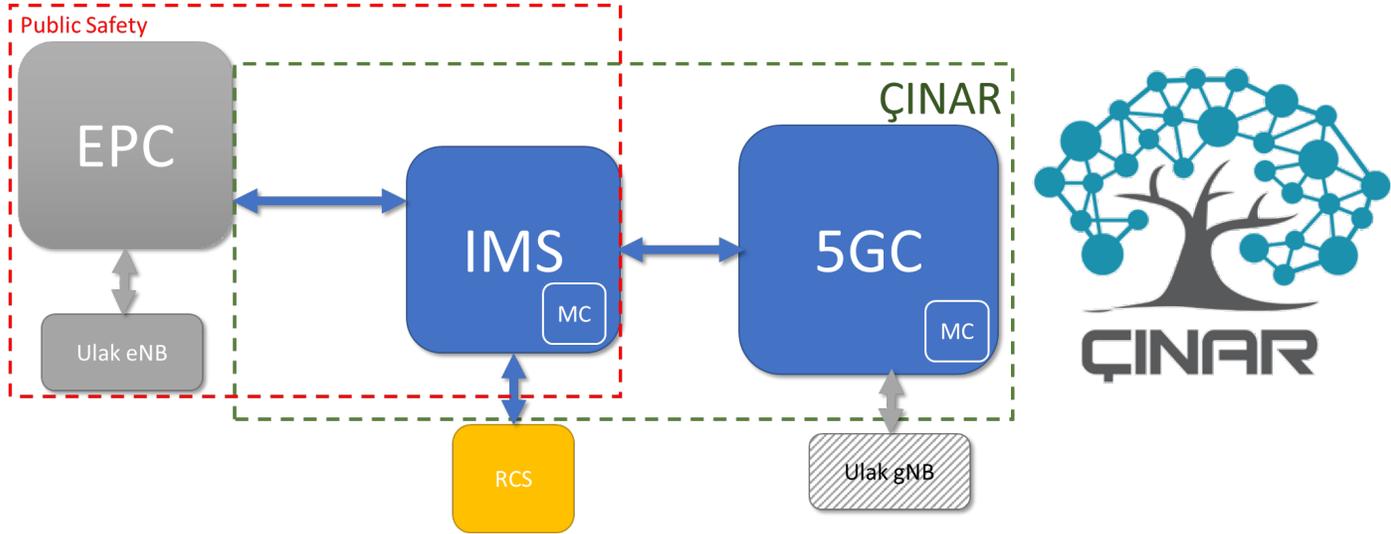

**DATA CENTER (SD-DC)**

**CRITICAL INFRASTRUCTURE (SD-Critical)**

**Robust and Reliable Communication Infrastructure with ULAK MAYA**

CONFIDENTIAL

# ULAK 4.5G/5G Core Network Solution

- => Public Safety & Emergency Call
- => Mobil Operators Network Infrastructure
- => Armed Forces Mobil Network Infrastructure

*Development & Integration on going*

# Transforming the Network Infrastructure...

**Our journey with Open Networking started in early 2015**

**with ARGELA (Supported by Defence Industry Agency)**

**...with a heavy mission to transform networks ;**

**more agile ,**

**more secure ,**

**more efficient**

## What we looked for ..

- Scalability
- High Performance
- Resiliency
- Open Standarts
- Next-Generation Networks support
- 5G Enabler Platform

We decided to continue this journey with **ONOS**

## What we did ..

- Developed in house **ONOS** based **MILAT SDN / NFV Framework** in two years with the effort more than 100 man-year.
- Contributed many features to ONOS and OpenFlow (*Especially on Openflow 1.5 Support, ONOS OVSDB Feature Enhancements and Performance Healings on Topology Discovery Process*)
- We productized **MILAT** as:
  - **MAYA SD-WAN** and
  - **MAYA SD-DC** solutions in the last two years.
- We are now developing **5G Core Network (CINAR)** based on **MAYA SDN IP Core**

## How we use ..

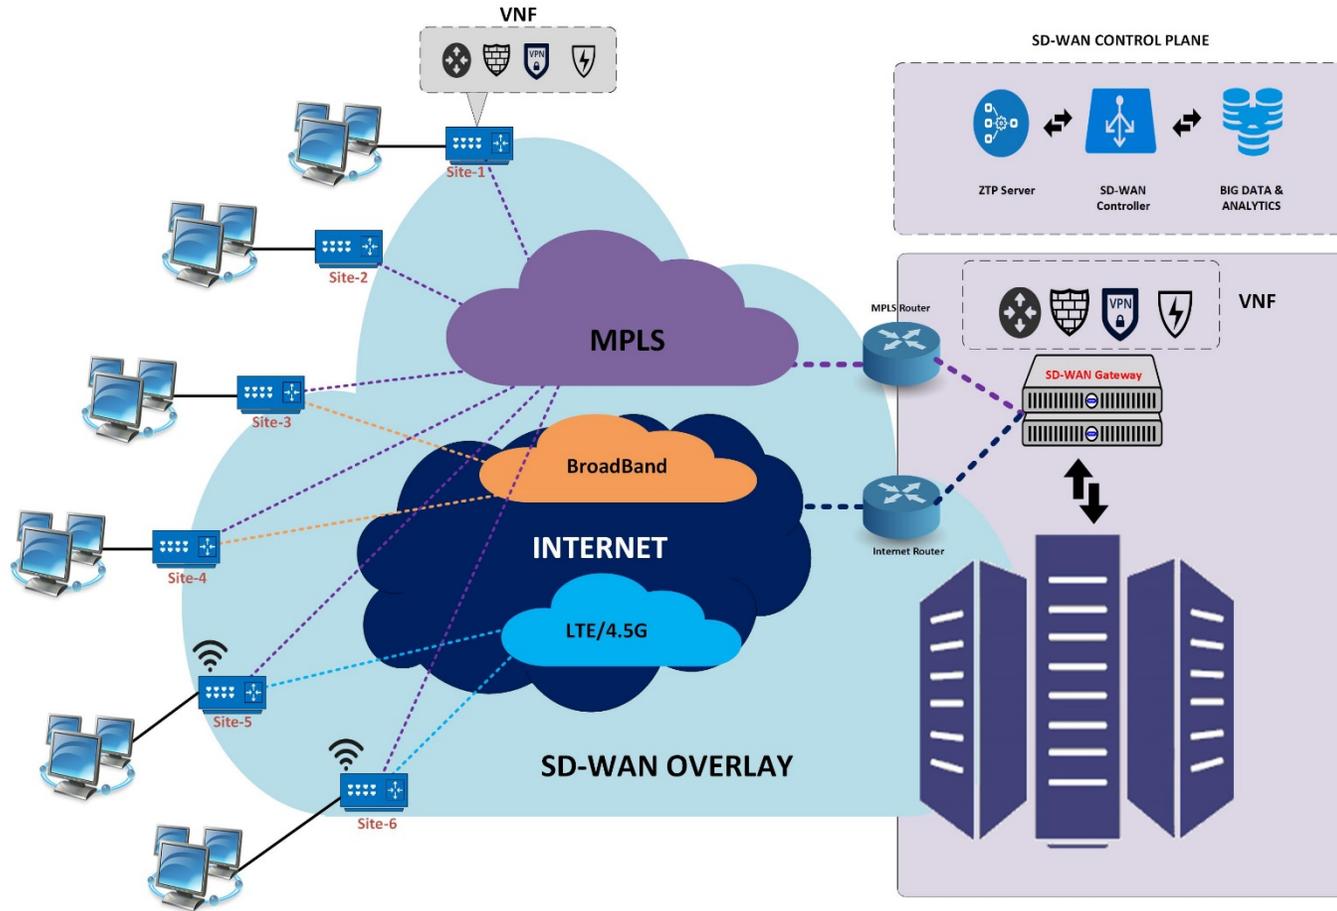

- We locate ONOS as the brain of network control plain.
- We develop all our product's features, as an application, over ONOS controller
- Modular architecture of ONOS was very helpful for us during development phase
- By the help of comprehensible code format, we can easily contribute extra features and improvements on ONOS code base.

**ONOS**  
Open Network Operating System

## Where we use ..

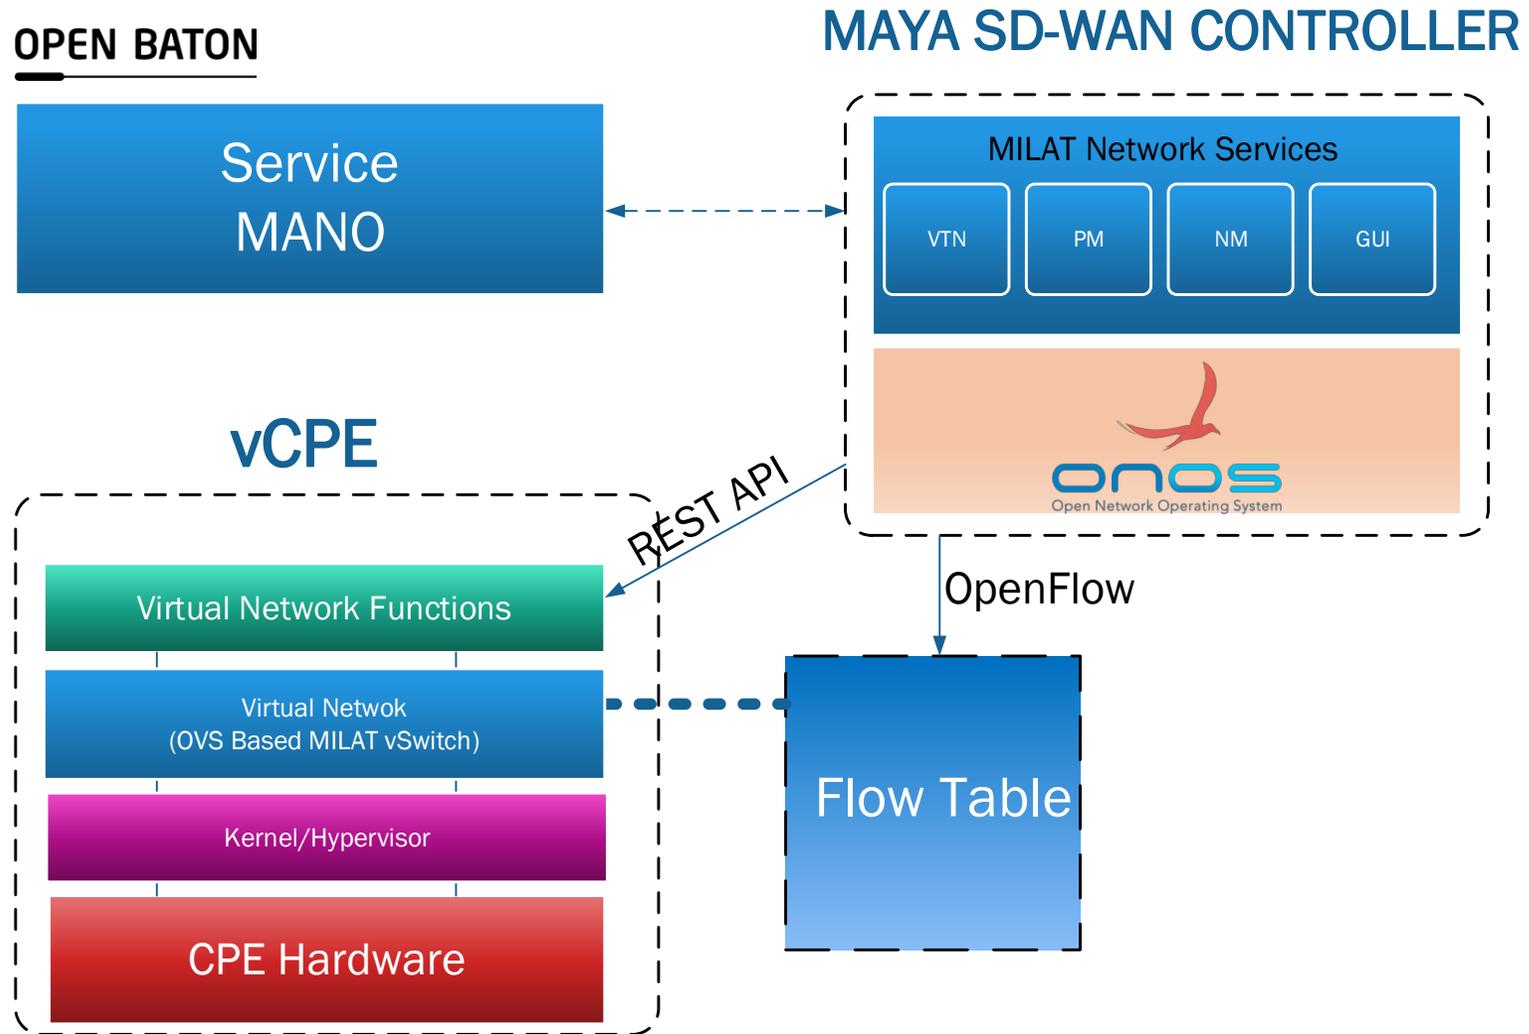

- Maya SD-WAN – Integrated with CPEs :  
Milat Manages and Controls Flows, Network Functions and OVS Bridges on Edge Devices
- Maya SD-DC – Integrated with OpenStack as NFVI and OpenBaton as Orchestrator :  
Milat controls networking stack by ONOS VTN Application and manages network functions by integrated OpenBaton
- Maya SD-CORE – Integrated with OFDPA Supported Switches :  
Milat configures Leaf and Spine switches for multipathing and redundancy features by enhanced version of ONOS Segment Routing App

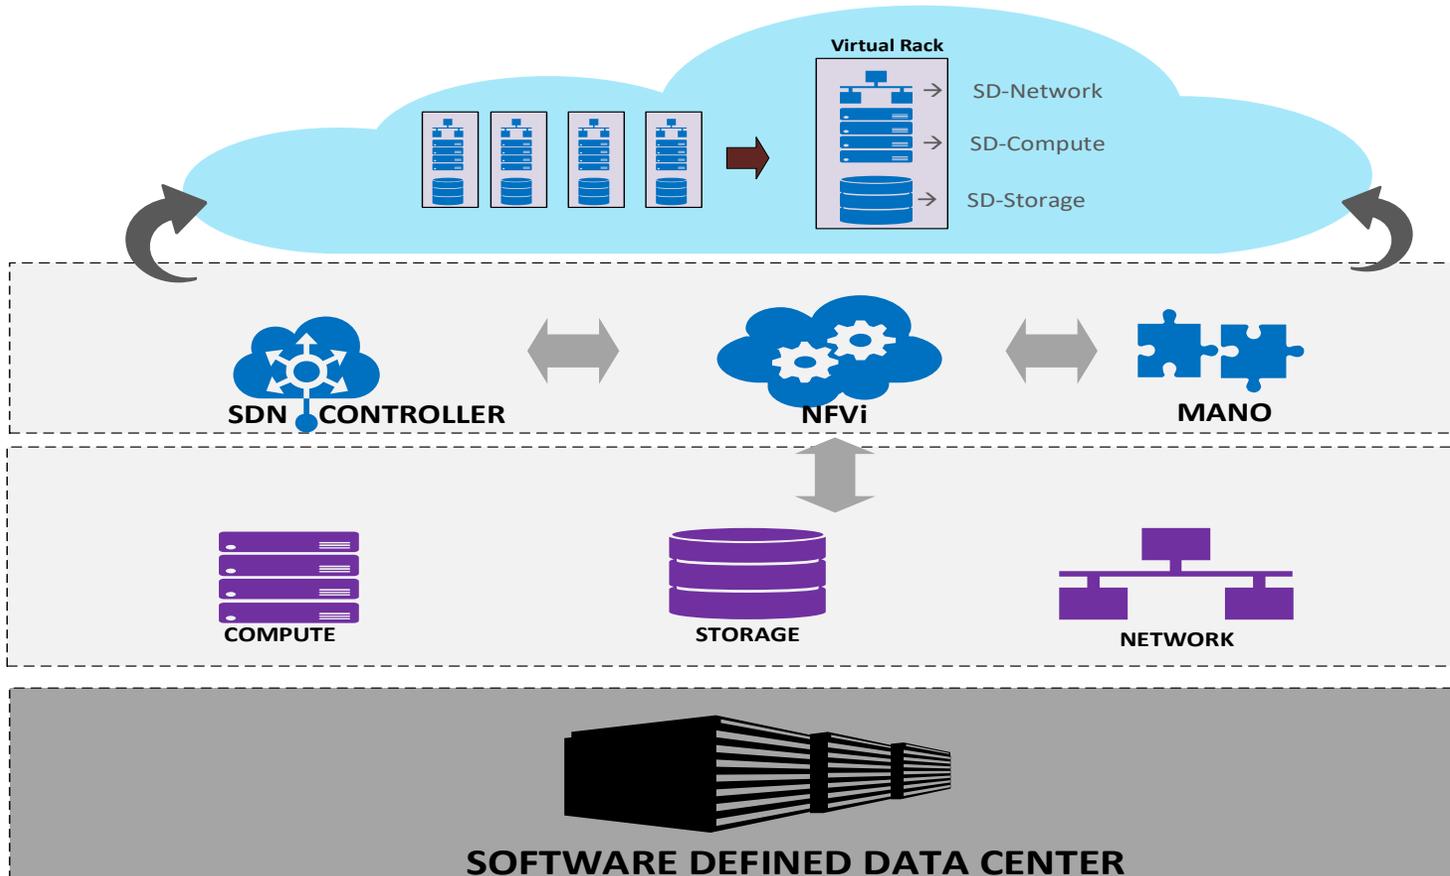

## MAYA SD-WAN

- Deployed to customers including:
  - Military,
  - Gov. Organizations,
  - Municipalities institutions,
  - Private Organizations,
 in TURKEY.
- SDN/NFV Based Secure and Agile WAN
- Control and DataPlane separation with OpenFlow
- Cost efficient and high performance Networks

## MAYA SD-WAN TOP LEVEL ARCHITECTURE & ONOS INTERFACES

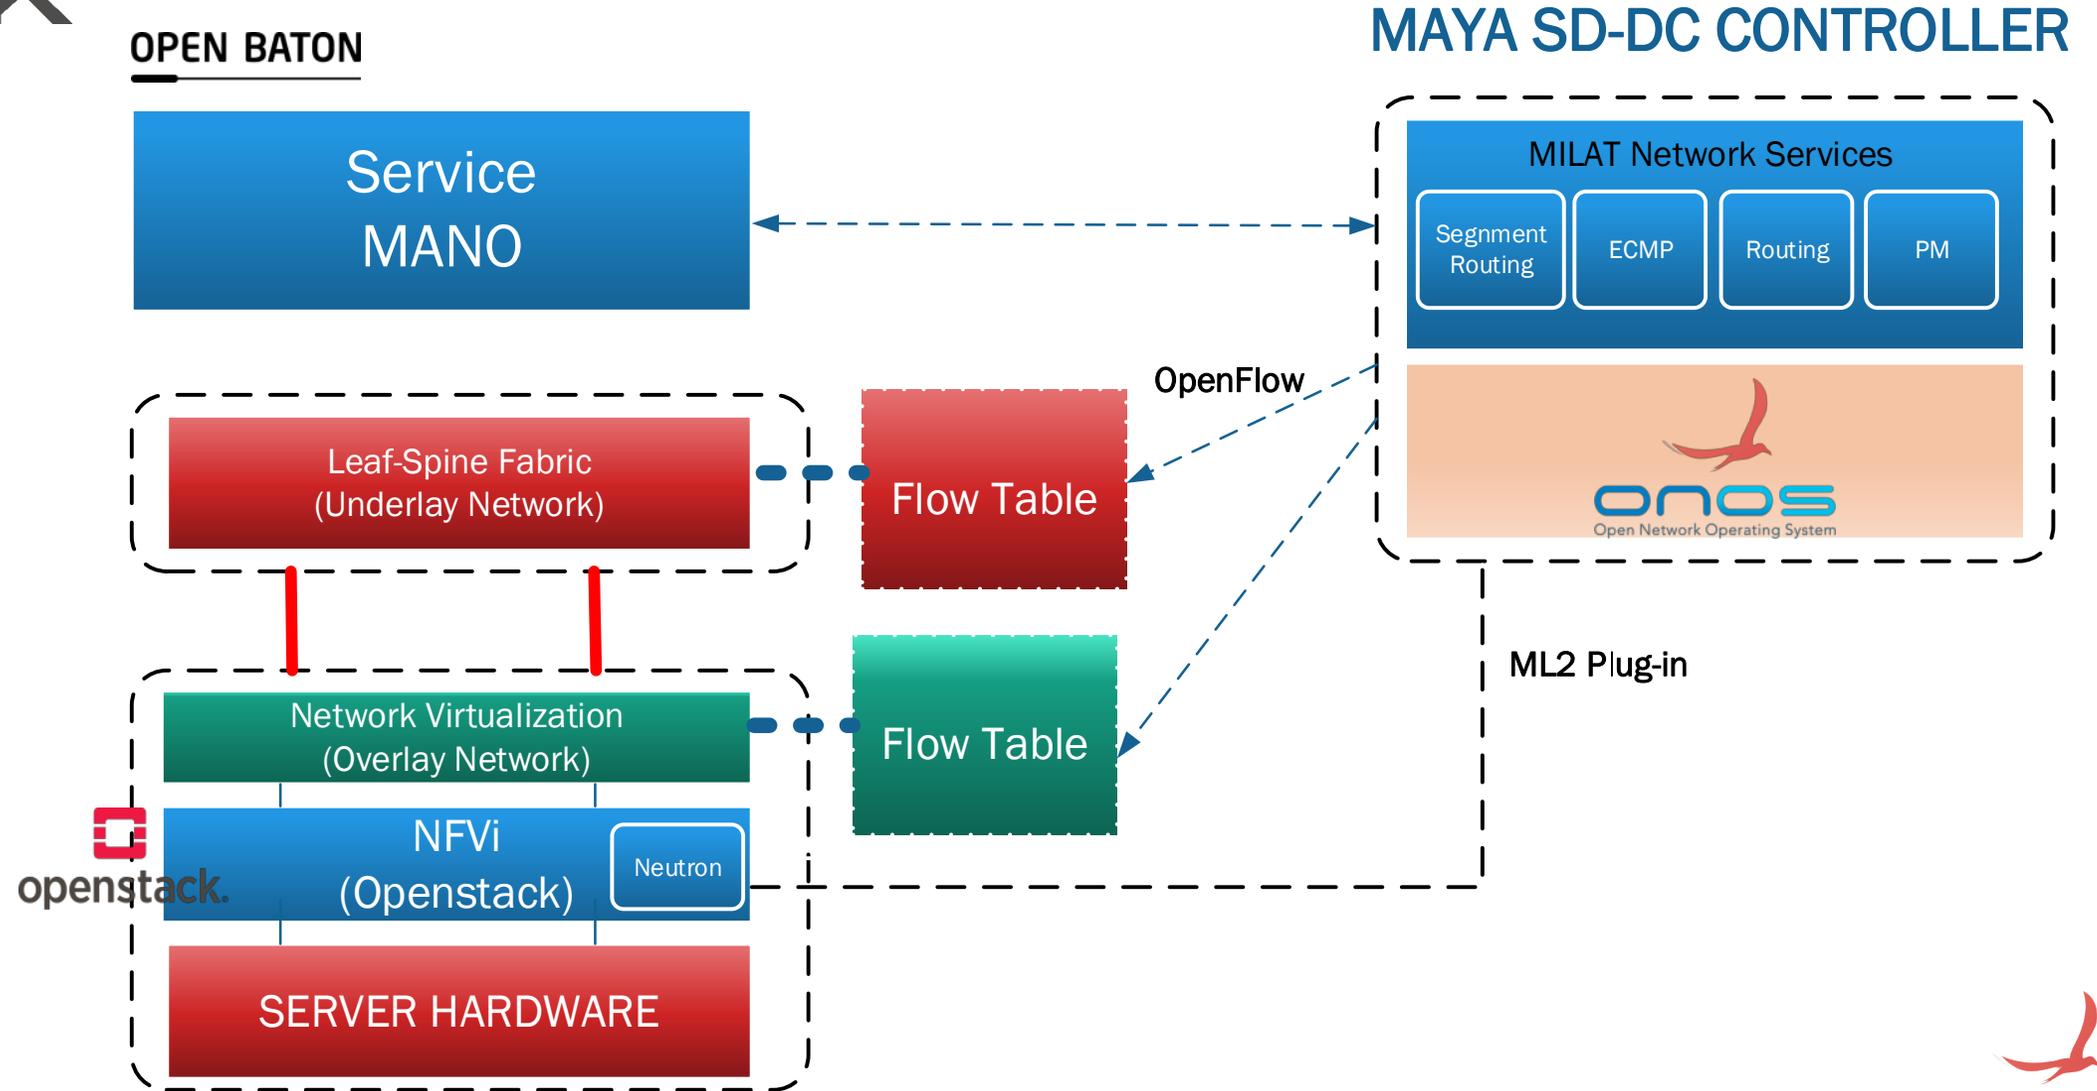

## MAYA SD-DC

- Underlay and Overlay Network Control with MILAT SDN Controller
- Network Virtualization and Multitenancy with Openstack Integration
- Open Architecture with WhiteBox Switches and COTS Hardware
- High Performance and Cost Efficient Service Oriented Architecture

## MAYA SD-DC TOP LEVEL ARCHITECTURE & ONOS INTERFACES

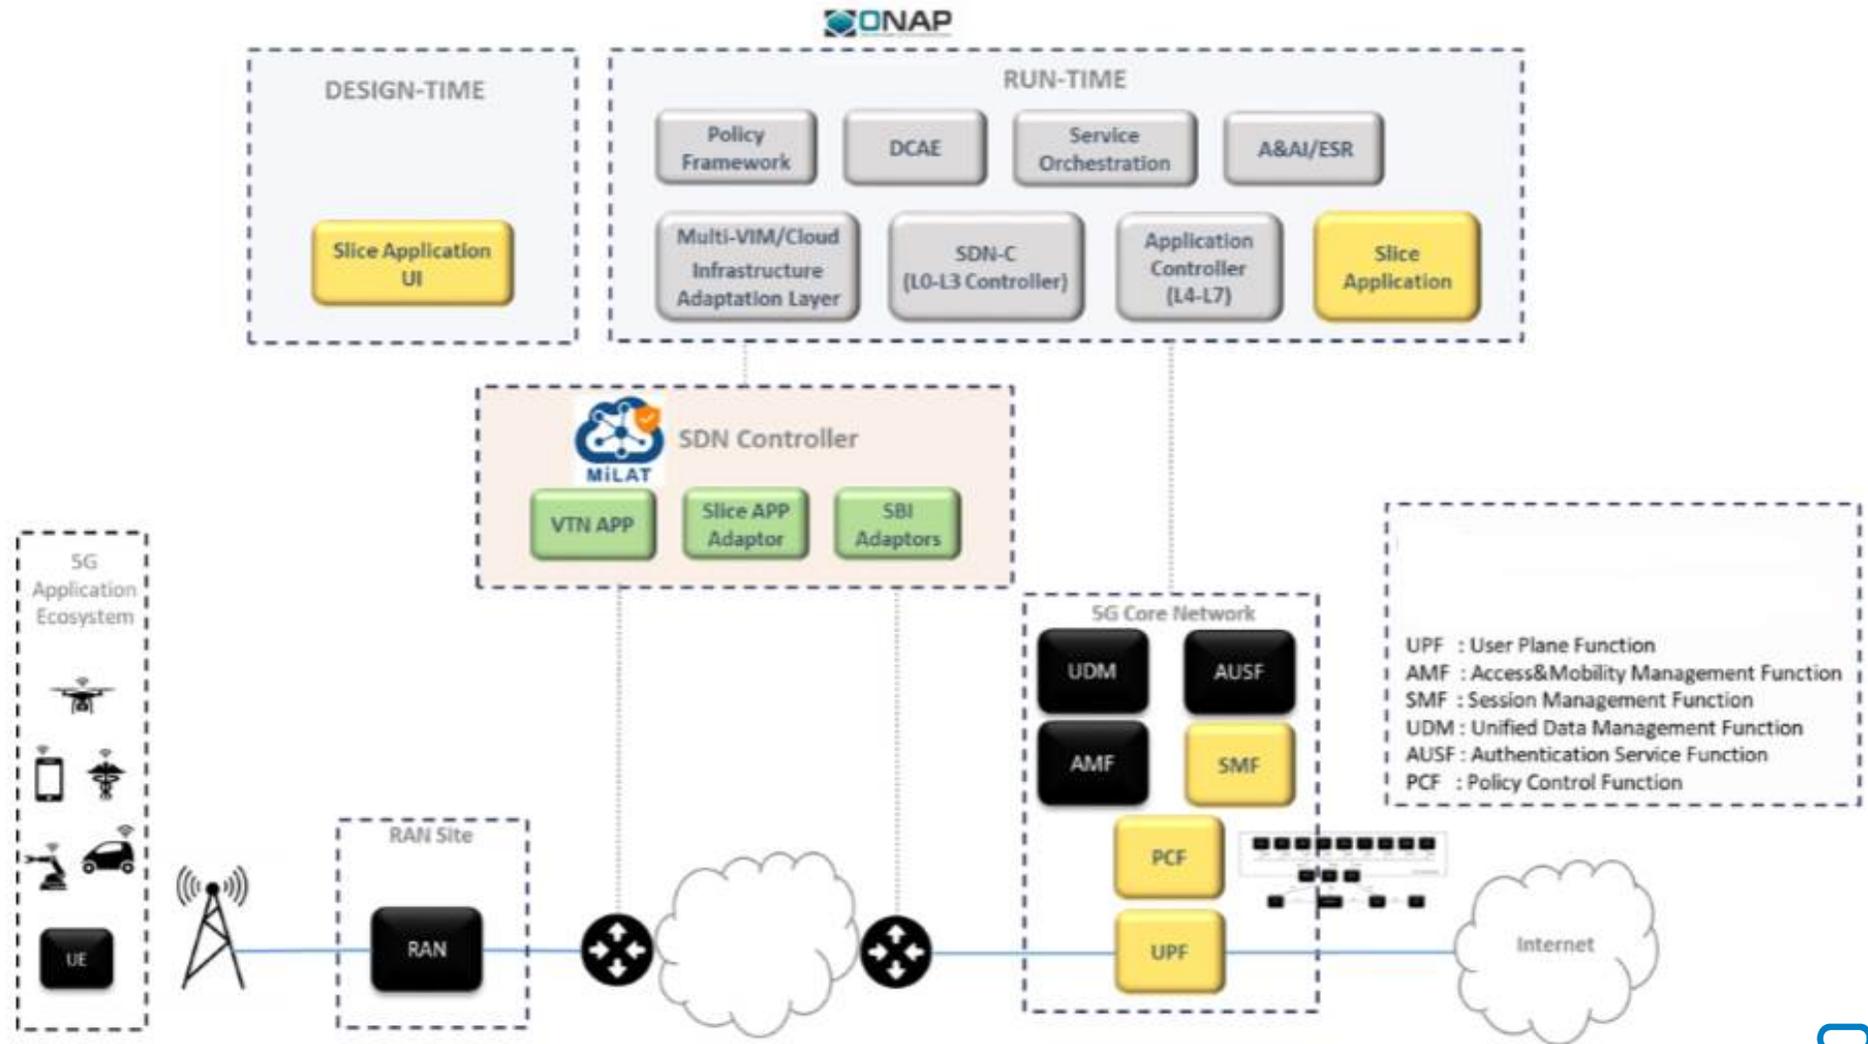

## ONOS Key Benefits for MAYA SD-WAN

- Control Plane and Data Plane Separation with ONOS **Southbound Interface (SBI)** via OpenFlow
- Network Programming with ONOS **Northbound Interface (NBI)** via **RESTFULL API**
- Network Virtualization Management via OVSDB

## ONOS and TRELIS Key Benefits for MAYA SD-DC

- Control Plane and Data Plane Separation with ONOS **Southbound Interface (SBI)** via OpenFlow
- TRELIS ECMP routing for multi-pathing and segment routing path control for selected traffic
- TRELIS distributed virtual routing to all tenant traffic in the overlay
- TRELIS Integrates both underlay and overlay configuration and control
- TRELIS Eliminates complex control protocols in the fabric nodes (no need to BGP implementation)
- Reduce Cost and Maximise DC Network Performance with White Box Leaf-Spine Fabric Architecture

# ULAK 5G CORE NW (CINAR) TOP LEVEL ARCHITECTURE & ONOS INTERFACES

## What we achieved..

- High Performance Networks
- Cost Efficiency
- More Agility
- Open Architecture
- Trust on MAYA, an ONOS Based system

**5G Architecture, functionality and flexibility already fielded at the edge  
Getting Ready for 5G gNR integration.**

**THANK YOU !**
