OMEC Tutorial Organization

- Opening- Stage setting
- Architectural Overview- Features, Functionality, Performance
- Demo Video- Test Drive OMEC
- Contribution of features and bug fixes to OMEC
- OMEC CI/CD
- Q & A

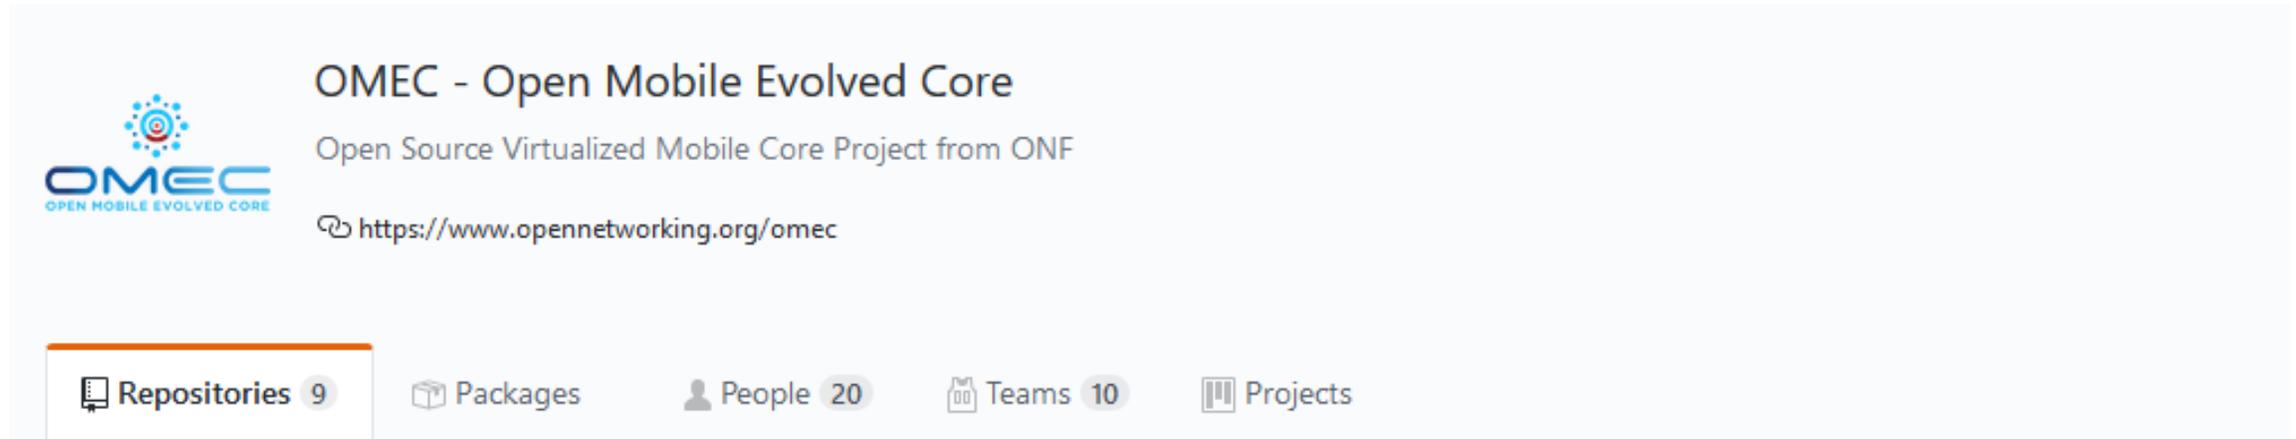

OMEC Goal

Can we securely run Telco core infrastructure on high volume servers to deliver operational capacity?

freediameter

FreeDIAMETER packages the IETF RFC 6733 DIAMETER base protocol to provide an Authentication, Authorization, and Accounting (AAA) framework between the EPC elements- MME <S6a interface> HSS; Packet Gateway Control (PGWC) <Gx interface> PCRF.

il_trafficgen

IL_Trafficgen is a DPDK packet gen based traffic generator which together with the built-in test features in the NGIC provide a simple means of testing the performance envelope and operation of the EPC. The IL_Trafficgen S1U generator generates Uplink (UL) GTPU packets on the S1U interface to the Serving Gateway User Plane (SGWU) for a defined n...

deployment

Deployment repository is a set of terraform based tools for efficient and automated building of OMEC based VNF infrastructure. It packages a set of scripts to build, configure and deploy the KVM based Virtual Machines (VM) over which the each of the constituent OMEC Network Functions can be installed, configured and operated.

oss-util

OSS-Util provides Application Programming Interface (API) to implement Command Line Interface (CLI) and logging support for all of the constituent OMEC applications. Using OSS-UTIL will make CLI and logging support common across all the applications. OSS-UTIL builds as a library which can be linked to any of the OMEC applications.

Open Mobile Evolved Core (OMEC)- Top level

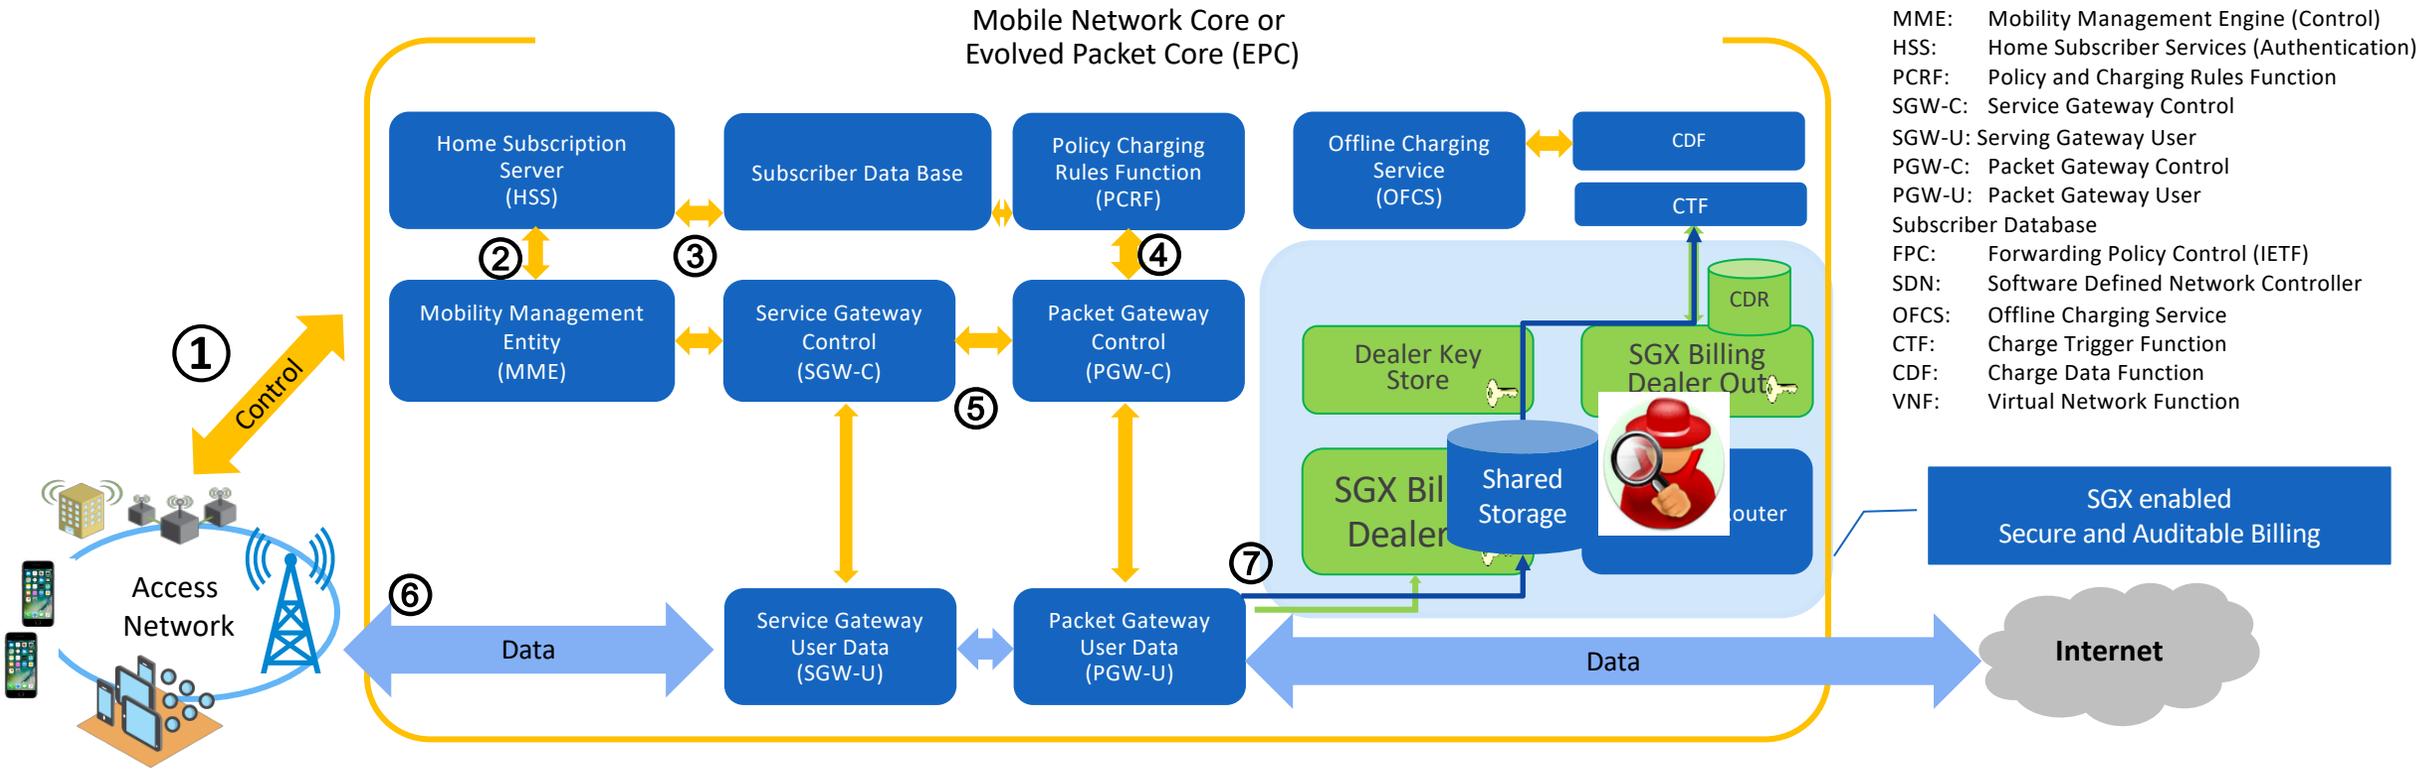

The Open Mobile Evolved Core (OMEC) is a package of seven individual repositories comprising 13 Virtual Network Functions (VNF)- Mobility Management Entity (**MME**), Home Subscription Server (**HSS**), Database (**DB**), Serving Gateway Control (**SGWC**), Serving Gateway User Plane (**SGWU**), Packet Gateway Control (**PGWC**), Packet Gateway User Plane (**PGWU**), Charge Data Function (**CDF**), Charge Trigger Function (**CTF**), Intel® Secure Guard Extensions CDR Dealers-In (**SGX-DLR-IN**), Intel® SGX Dealer-Out (**SGX-DLR-OUT**), Intel® SGX Key-store (**SGX-KMS**) and **CDR-ROUTER**

OMEC includes:

- Components that have gone through Intel's SWLC and SDL process (including code scans to prevent license contamination)
- Complete connectivity, Secure billing and charge data handling capabilities
- 3GPP Release 13 compatible*
- Optimization for lightweight cost effective deployments and IoT applications
- Integrated CI/CD test and verification capabilities
- <https://github.com/omec-project>

* Refer release notes- issues and constraints

OMECA 1.0 – Fully Featured & Intel® SGX Secure Billing

E2E Comprehensive EPC Infrastructure:

- Fully secured distributed Xeon E3 based SGX enabled billing system, automated, real time billing data collection and storage.
- SGX based secured, auditable mutual attestation. Guaranteed confidentiality and integrity of Charge Data Records (CDRs)
- Cross platform deployment orchestration, provisioning and network configuration tools ready- KVM, AWS, Docker, K8, ...

Reducing the “Attack Surface” with Software Guard Extensions (SGX)

Application gains ability to defend its own secrets

- Smallest attack surface (App Memory + processor)
- Malware that subverts OS/VMM, BIOS, Drivers etc. cannot steal app secrets

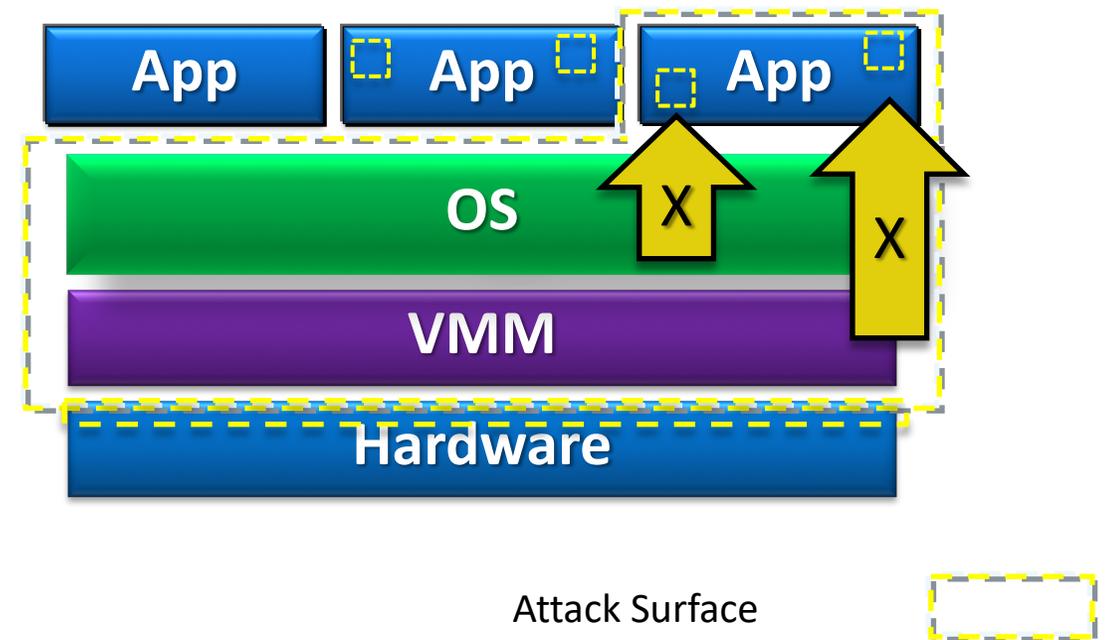

Familiar development/debug

- Single application environment
- Build on existing ecosystem expertise

Familiar deployment model

- Platform integration not a bottleneck to deployment of trusted apps

Attack surface with Enclaves
Attack surface today

Scalable security within mainstream environment

OMEC Functionality & Performance

1. Comprehensive E2E- 12x VNFs (MME, HSS, DB, SGWC, PGWC, SGWU, PGWU, SGX-DLR-IN, SGX-KMS, CDR-RTR, SGX-DLR-OUT, CTF, CDF)*
2. Fully secured, scalable and auditable SGX based integrated billing record processing
 - SGX E3 server platform based system - One SGX Billing Frame capable of handling upto 7 DP Frames
3. DP (SGWU-PGWU) Run-To-Completion model
 - 4 cores delivering ~2.5 MPPS across 500K flows
 - SGWU/PGWU can also be protected with Intel® SGX based servers
4. SGWU-PGWU* interfaces are Linux aware and operable. Key Operational requirement.

* Linux commands Route, ADD tables direct fast path frames
